Exercise 2: Beer catalogue

Write a simple application that shows an ordered list of beers. When you tap on one of the elements, it should show a detail with all relevant data of the selected beer. The application has to fetch data from Punk Api (https://punkapi.com/).

Required:
- Has pull to refresh in the list
- Pagination handling is NOT required
- Displays at least name and picture in the list, and much more data in the detail

Pay attention to write good code and to solve the problem in the cleanest way possible. You can use all the libraries you need.

For submission you have to deliver us the full git repository with the project you are working on (as a .zip file or giving us access to a private github/gitlab repo).
